Product Details

Background:	Rkhd4, also known as MEX3A is a member of a novel family of four homologous human MEX3 proteins each containing two heterogeneous nuclear ribonucleoprotein K homology (KH) domains and one carboxy-terminal RING finger module. MEX3 proteins, including Rkhd4, are phosphoproteins that bind RNA through their KH domains and shuttle between the nucleus and the cytoplasm via the CRM1 export pathway. These proteins are a novel family of evolutionarily conserved RNA-binding proteins, differentially recruited to P bodies and potentially involved in post-transcriptional regulatory mechanisms. While Rkhd2 has been suggested to be associated with susceptibility to essential hypertension type 8, the function of Rkhd4 remains unknown. Rkhd3 and Rkhd4, but not Rkhd2, co-localize with both the hDcp1a decapping factor and Argonaute (Ago) proteins in processing bodies (P bodies), recently characterized as centers of mRNA turnover.
Synonyms:	Rkhd4 Antibody, RKHD4, MEX-3A, RKHD4, RNA-binding protein MEX3A, RING finger and KH domain-containing protein 4

Target Details

Gene Name:	MEX3A
Reactivity:	Human, Mouse, Rat

Immunogen Type:	Conjugated Peptide
Immunogen:	Anti-Rkhd4 antibody was prepared from whole rabbit serum produced by repeated immunizations with a 14 amino acid synthetic peptide from near the C-terminus of human Rkhd4. The immunogen is located within amino acids 420-470 of RKHD4.
Purity/Specificity:	Anti-Rkhd4 Antibody was affinity purified from monospecific antiserum by immunoaffinity chromatography. Cross reactivity with Rkhd4 from other sources has not been determined.
