Product Details

Background:	Z-DNA binding protein 1 (ZBP1) belongs to a family of proteins that contain the Zalpha domain which binds specifically to left-handed Z-DNA and Z-RNA. ZBP1 was initially identified as a novel gene that was up-regulated in activated macrophages in mice bearing ascites tumors, suggesting that is may play a role in processes such as host response in neoplasia. More recent reports indicate that the cytosolic ZBP1 has can act like the toll-like receptor TLR9 by detecting cytosolic double-stranded (ds) DNA and trigger induction of type I interferon and other innate immune responses. It is thought that the binding of ZBP1 to dsDNA enhances its association with innate immune response proteins such as the IRF3 transcription factor and the serine/threonine kinase TBK1 (also known as NAK). Multiple isoforms of ZBP1 are known to exist.
Synonyms:	ZBP1 Antibody, DAI, DLM1, DLM-1, C20orf183, Z-DNA-binding protein 1, Tumor stroma and activated macrophage protein DLM-1
Host Species:	Rabbit
Clonality:	Polyclonal
Format:	IgG

Target Details

Gene Name:	ZBP1
Reactivity:	Human, Mouse, Rat
Immunogen Type:	Conjugated Peptide

Immunogen:	Anti-ZBP1 antibody was prepared from whole rabbit serum produced by repeated immunizations with a 18 amino acid synthetic peptide from near the C-terminus of human ZBP1. The immunogen is located within the last 50 amino acids of ZBP1.
Purity/Specificity:	Anti-ZBP1 Antibody was affinity purified from monospecific antiserum by immunoaffinity chromatography. Cross reactivity with ZBP1 from other sources has not been determined. Multiple isoforms of ZBP1 are known to exist.
